

CHOLERA.

ITS RATIONAL TREATMENT.

CHOLERA, like Typhoid Fever, Dysentery, and Ulcerated Bowels, can only be rationally treated by the internal administration of a non-poisonous germicidal agent and antiseptic. **SANITAS DISINFECTING FLUID** is such an agent, and I have experimentally demonstrated, that although, when present in sufficient amount, it arrests the digestive action of pepsin and other like ferments, yet the quantity required to wholly arrest the action of micro-organisms is far smaller, so that it may be safely given in doses which will not seriously interfere with digestive processes. [See "Nature's Hygiene" (Baillière & Co.), pp. 376-388.]

Dr. WEEKS has demonstrated the fact that Sanitas Fluid destroys the vitality of the Typhoid Bacillus in exposures of four minutes, and when diluted with an equal quantity of water in exposures of ten minutes, and I have no doubt it is equally destructive of the Choleraic micro-organisms.

"Sanitas Disinfecting Fluid" is not merely a powerful germicide and antiseptic, but acts also as a gentle oxidising agent, while it is quite free from toxic effects.

DOSE.—A tablespoonful mixed with an equal quantity of water, several times daily.

Apart from its special value in such cases, "**Sanitas Disinfecting Fluid**" constitutes an ideal Antiseptic wash and general disinfecting agent for universal use.

Scientific Reports will be sent on application to

THE SANITAS COMPANY, LIMITED,
BETHNAL GREEN, LONDON.
