Miss Prentice gained her health visiting training at the National Health Society, London.

LEGACIES FOR NURSES.
The Hon. Robert White, of East Sheen, left £2,000 to his nurse, Mary Anne Langran, “for the purchase of an annuity.”

The late Mr. Henry G. Elwes, of Colchester, left an annuity of £150 “to his faithful and devoted nurse, Sister Edith Octavia Walford.”

INSULIN RESEARCH IN DENMARK.

In a recent issue of The International Nursing Review, the official organ of the International Council of Nurses, the following note from The Diabetic Journal appears:

The Diabetic Journal in a recent issue describes some of the results of the research which has been in progress for three years at an insulin hospital and factory near Copenhagen, with the object of discovering a new type of insulin compound which would be absorbed more slowly from the site of injection. About 30 new preparations have been tried, and a compound has been obtained which partly meets the requirements. This compound, known as “protamine insulinate,” is a chemical combination of insulin and protamine, a type of protein obtained from fish roe. Owing to its slow absorption rate, its action is more prolonged, less violent, and less likely to produce hypoglycaemia through temporary overdose. The new compound is given in the evening, to control the diabetes during the night, and to keep the blood sugar normal before breakfast, and ordinary insulin is given in the morning, to deal with the carbohydrate food eaten during the day, as protamine is rather too slow in its action to control the sugar after a large meal has been taken. Thus even the most severe cases should not need more than two injections a day, while it is hoped in time to find a means of controlling them with only one injection a day.

To nurses the most interesting feature of the institution is the small hospital, taking 22 patients. These are mostly severe cases of diabetes, but a few cases of nictabical diseases, obesity and other endocrine diseases, are taken.

The hospital, named after Niels Stiensens, the famous Danish surgeon of the fifteenth century, is spacious and lavishly equipped, and there are never more than two patients in a room. In the five kitchens which occupy the ground floor there are trained dietitians prepare and weigh the food, and teach the patients how to manage their diet. The top floor is devoted to investigation and research; there are two large chemical laboratories, modern X-ray apparatus; an operating theatre, and special rooms for metabolic work. The whole hospital is equipped with hot linen cupboards, and cold refrigerators recesses for food and for preserving samples of urine. The nursing staff consists of five sisters and nurses. A microphone is installed in every room and transmits any sound of illness or disturbance to the night sister’s room; this is only one of many modern mechanical devices. The director and manager, Dr. Hagedorn, is said to be a scientific, mechanical and financial genius. The institution, which thrives without outside help, is financed by the sale of insulin, and owes its success to its extremely efficient organisation. —Extract from The International Nursing Review.
